

Structural and pharmacological evidence differentiates candidate tractability

Experimental structural evidence and audited pharmacological maturity across the four focus genes.

KDM1A

Lysine demethylase

PDB 6NQU

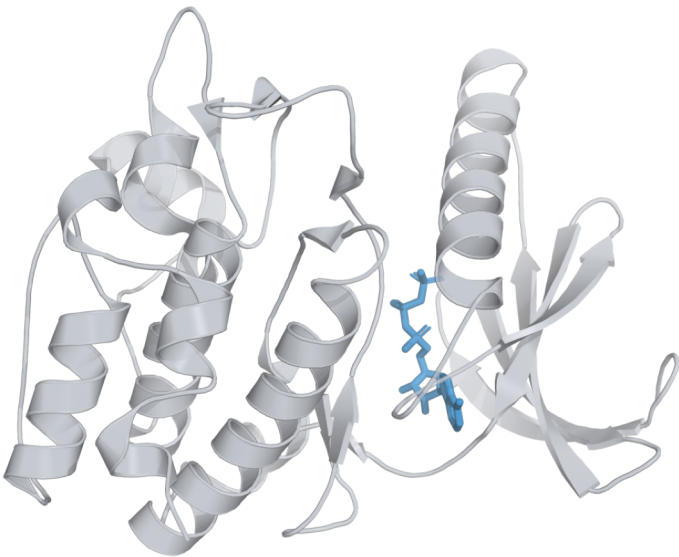

Experimental inhibitor-bound structure

GSK2879552 (selective inhibitor)

TLK2

Ser/Thr kinase

PDB 500Y

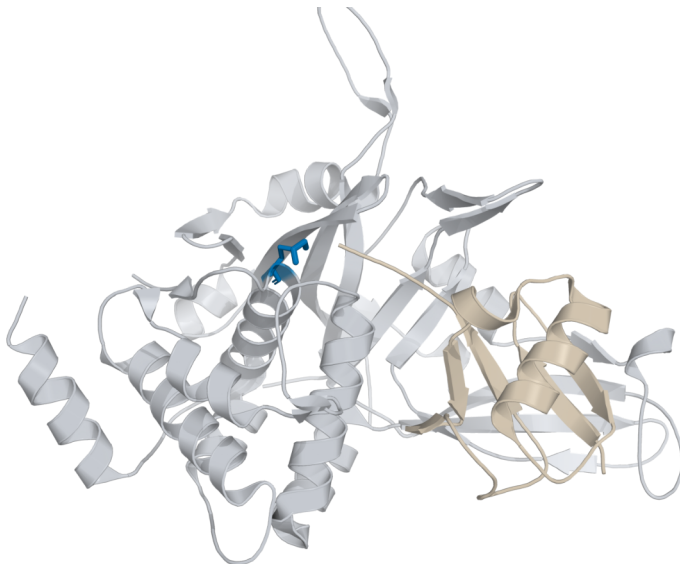

Experimental kinase-domain structure

ATP-γ-S substrate analog — not an inhibitor

USP34

Deubiquitinase

PDB 7W3U

Experimental catalytic-domain structure

Covalent activity-based probe — not a drug

VEZF1

Zinc-finger transcription factor

no PDB entry

No experimental structure

six tandem zinc fingers (domain schematic)

No experimental structure identified in the audited analysis

Homology model only

Experimental structure

Direct ligand / probe evidence

Selective or clinical pharmacology

e.g. iadademstat / ORY-1001

ATP-site structure; TLK1-paralog selectivity unsolved

reactive catalytic Cys1903

weak published screening hit (IC50 ≈ 20 μM)

Evidence:

established

limited / not a drug

none

Structural evidence indicates tractability, not efficacy. No docking or binding prediction was performed; a bound ATP analog or activity-based probe is not a therapeutic inhibitor.
