

DepMap separates tamoxifen sensitisation from baseline dependency

Chronos gene-effect scores across the frozen ER+/luminal breast-cancer cell-line subset (DepMap 26Q1, n = 11).

More negative Chronos score = stronger baseline dependency. ○ = dependency probability > 0.5 (frozen strong-dependency criterion).
Baseline dependency in cancer cell lines is a different measurement from tamoxifen-specific sensitisation, and is not evidence of normal-tissue safety.
