

Estrogen response: DOWN in every context

EMT: UP in resistance/recurrence, DOWN in acute 12h

Both panels: real NES from the already-frozen per-dataset GSEA tables. \* = FDR < 0.05. GSE118713/GSE111151 = resistance models; GSE240112 = recurrence-associated (human); GSE245601 = acute 12h (gray). NES is not directly comparable across gene sets of different size (e.g. early vs. late estrogen response) -- compare each pathway's own trend across datasets.
