

Proposed follow-up experimental arms, per candidate

KDM1A

control

4-OHT

+ iadademstat

4-OHT + iadademstat

TLK2

control

4-OHT

TLK2 knockout

4-OHT + TLK2 KO

USP34

control

4-OHT

USP34 knockout

4-OHT + USP34 KO

VEZF1

control

4-OHT

VEZF1 knockdown

4-OHT + VEZF1 KD

○ unperturbed cell    ● genetic/pharmacological perturbation    ○ 4-OHT / tamoxifen exposure

*KDM1A: existing clinical-stage inhibitor enables a pharmacological arm. TLK2/USP34/VEZF1: no validated inhibitor exists, so genetic perturbation (knockout/knockdown) is the only current option -- a real, disclosed asymmetry, not an oversight.*
